Summary

Data scientist and AI engineer focused on forecasting, feature engineering, decision intelligence, and analytics-ready data pipelines. Experienced in LightGBM/Scikit-learn, time-aware validation, SQL/Python analysis, and translating model signals into business decisions.

Education

Chulalongkorn University, B.Eng. in Electrical Engineering – Bangkok, Thailand

Aug 2022 – May 2026

- GPAX: 3.44 / 4.00; Second-class honours.
- Relevant coursework: Data Science, Data Engineering, Estimation, Statistical Learning, Optimization.
- Capstone: Generative Video-Based Sky Image Forecasting for Thai sky images using VQ-VAE-based video prediction.

Skills

Programming / Analytics: Python, SQL, Pandas, NumPy, Scikit-learn, Jupyter, data cleaning, exploratory analysis

Modeling: LightGBM, time-series forecasting, regression, clustering, feature engineering, walk-forward validation, SHAP/error analysis

Data Engineering: PostgreSQL, Airflow, dbt, PySpark, Docker, schema validation, analytics-ready data modeling

Applied AI: PyTorch, OpenCV, Hugging Face, RAG, FastAPI

Experience

AI Engineer, Part-time, Hobbit Technologies – Bangkok, Thailand

Feb 2026 – present

- Built PostgreSQL-backed workflows for CEFR-aligned content generation, evaluation, and grammar-correction use cases.
- Used schema validation and structured LLM outputs to improve data quality for downstream evaluation and analytics workflows.
- Developed FastAPI/Next.js service boundaries that made model outputs traceable, reusable, and easier to audit.

AI Engineer Intern, Hobbit Technologies – Bangkok, Thailand

June 2025 – Aug 2025

- Built data-cleaning, dataset-versioning, and drift-check workflows for computer-vision experiments on industrial sensor data.
- Designed active-learning triggers that reduced labeling cost by approximately 20k THB/year.
- Deployed Grafana/Prometheus monitoring to track Edge AI inference failures and support operational root-cause analysis.

Electrical Engineering Intern, AGC Flat Glass – Bangkok, Thailand

June 2024 – Aug 2024

- Analyzed machine and production signals to support operational-efficiency improvement of approximately 10%.
- Built a control-logic prototype that connected production data with PLC workflows.

Projects

Coffee Chain Demand Forecasting System

- Built a leakage-safe daily sales forecasting pipeline for representative coffee stores using horizon-safe lags, rolling statistics, event proximity, calendar, and store-category behavior features.
- Reduced internal walk-forward CV MAE by 12.2% and converted model signals into inventory, order-planning, and local-event demand insights.

On-Demand Delivery Data Platform & Decision Intelligence System

- Built ETL/ELT workflows with Python, PostgreSQL, Airflow, dbt, and Docker to transform raw JSON events into analytics-ready tables and feature-store structures.
- Added schema validation and time-aware model validation to support ETA, delay-prediction, and operational decision experiments.

Football Player Value Forecasting & Similarity Recommendation System

- Developed time-series regression and clustering pipelines to forecast player market value and group players by role similarity.
- Translated forecasting errors and cluster structures into recruitment, benchmarking, and decision-support insights.

Generative Video-Based Sky Image Forecasting for Thai Sky Images

- Implemented a VQ-VAE-based forecasting model and evaluated temporal prediction quality with PSNR-oriented validation.
- Achieved 37.32 dB peak validation PSNR, a 16% improvement over baseline.

Competitions

Thailand Super AI Engineer Season 6 — Coffee Chain Time-Series Hackathon 2026

- Led research and feature engineering for daily coffee-sales forecasting across representative stores.
- Built technical evidence for the pitching track by connecting forecasting features to inventory and order-optimization decisions.

Microsoft AI Engineering Skills and Hackathon for Employment 2026 2026

- Reached finalist team stage among 2,000+ participants.
- Built a dashboard-driven emergency-case intake and evaluation pipeline with measurable SLA and data-completeness framing.

Thailand Super AI Engineer Season 6 — Edge AI for Intelligent Transport Systems 2026

- Developed a computer-vision data pipeline for traffic monitoring and anomaly detection.
- Used VLM-assisted inspection and semi-supervised learning techniques to bootstrap external public datasets.

I-squared Hackathon — Motorbike Rider Anomaly Detection & Classification

- Built a two-stage computer-vision pipeline using YOLOv8 for detection and ViT for classification.
- Designed automated data-cleaning and image-enhancement workflows; reached semifinals with over 90% training accuracy and over 70% accuracy on unseen real-world images.
